Attorney Docket No.: VRT0089US

Dear Sir:

Transmitted herewith are the following documents in the above-identified application:

- (1) Return Receipt Postcard;
- (2) This Transmittal Letter (1 page) (*in duplicate*); and
- (3) Appeal Brief Under 37 CFR §41.37 (18 pages).

- ☐ No additional fee is required.
☒ The fee has been calculated as shown below:

- ☒ Fee Under 37 CFR § 1.191(f) for Filing a Notice of Appeal \$ 500.00
☐ Fee for Petition for Extension of Time \$ 0.00
☒ Conditional Petition for Extension of Time: If an extension of time is required for timely filing of the enclosed document(s) after all papers filed with this transmittal have been considered, an extension of time is hereby requested.
☒ Please charge our Deposit Account No. 502306 in the amount of \$ 500.00
☒ Also, charge any additional fees required and credit any overpayment to our Deposit Account No. 502306.

TOTAL \$ 500.00

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Box Appeal Brief-Patents, Commissioner for Patents, P. O. Box 1450, Alexandria, VA 22313-1450, on July 31, 2006.

APPEAL BRIEF UNDER 37 CFR § 41.37

Dear Sir:

This brief is submitted in support of the appeal filed May 26, 2006 by the appellants to the Board of Patent Appeals and Interferences from the Examiner's final rejection of claims 1-31. The appellants note that the appeal filed May 26, 2006 was received by the USPTO on May 31, 2006, thereby giving the appellants a period for filing set to expire on July 31, 2006.

Please charge deposit account No. 502306 for the fee of \$500.00 associated with this appeal brief. Please charge this deposit account for any additional sums which may be required to be paid as part of this appeal.

REAL PARTY IN INTEREST

The real party in interest on this appeal is Veritas Operating Corporation.

RELATED APPEALS AND INTERFERENCES

There are no appeals or interferences related to this application.

08/03/2006 YPOLITE1 00000084 10627385

STATUS OF CLAIMS

Claims 1-31 stand rejected under 35 U.S.C. § 102(e) as being anticipated by Frank, et al., U.S. Patent No. 6,532,494 (Frank). Claims 1-31 are being appealed.

STATUS OF AMENDMENTS

No amendments were filed subsequent to the final rejection of January 27, 2006.

SUMMARY OF CLAIMED SUBJECT MATTER

The invention is as set forth in the claims. To summarize the invention without intending to limit or otherwise affect the scope of the claims, the invention as set forth by independent claim 1 relates to a method. A coordinator virtual device corresponding to at least a portion of a physical data storage device is provided. See, for example, paragraphs 0031, 0032, 0040, 0048, and 0049 and **Figures 2 and 4**. Partitioning of a computer system cluster, including a plurality of nodes, is detected. See, for example, paragraphs 0043 and 0067 and **Figure 9**. An attempt is made to gain control of the coordinator virtual device. See, for example, paragraphs 0062-0064 and 0067, and **Figures 8 and 9**. At least one of the plurality of nodes from the computer system cluster is removed when the attempting is unsuccessful. See, for example, paragraphs 0068 and **Figure 9**.

The invention as set forth by independent claim 15 relates to a system including a first data storage device, a virtual device configuration server, and a plurality of virtual device configuration clients. See, for example, paragraphs 0030-0041 and **Figure 2**. The virtual device configuration server is coupled to the first storage device and includes a first memory and a first processor configured to provide a coordinator virtual device corresponding to at least a portion of the first data storage device. See, for example, paragraphs 0030-0041 and 0077-0078, **Figures 2 and 11**. The plurality of virtual device configuration clients are configured as a computer system cluster. *Id.* At least one of the plurality of virtual device configuration clients includes a second memory and a second processor. *Id.* The second processor is configured to detect when the computer system cluster is partitioned. See, for example, paragraphs 0043 and 0067 and **Figure 9**. The second processor is also configured to attempt to gain control of the coordinator virtual

device corresponding to at least a portion of the first data storage device. See, for example, paragraphs 0062-0064 and 0067, and **Figures 8 and 9**. The second processor is further configured to remove the at least one of the plurality of virtual device configuration clients from the computer system cluster when the attempt to gain control of the coordinator virtual device is unsuccessful. See, for example, paragraphs 0068 and **Figure 9**.

The invention as set forth by independent claim 28 relates to an apparatus. The apparatus includes a means for providing a coordinator virtual device corresponding to at least a portion of a physical data storage device. See, for example, the volume server 280 and related system components, coordinator volume 400, paragraphs 0031, 0032, 0040, 0048, and 0049, and **Figures 2 and 4**. A means for detecting when a computer system cluster, including a plurality of nodes, is partitioned is also included. See, for example, the network 240, software 310, paragraphs 0043 and 0067, and **Figures 2, 3, and 9**. The system further includes a means for attempting to gain control of the coordinator virtual device. See, for example, software 320, paragraphs 0043-0047, 0062-0064, 0067, and 0068, and **Figures 3, 8 and 9**. Finally, the system provides a means for removing at least one of the plurality of nodes from the computer system cluster when the attempting is unsuccessful. *Id.*

GROUND OF REJECTION TO BE REVIEWED ON APPEAL

- I. Claims 1-31 stand rejected under 35 U.S.C. § 102(e) as being anticipated by Frank, et al., U.S. Patent No. 6,532,494 (Frank).

ARGUMENT

Claims 1-31 stand rejected under 35 U.S.C. § 102(e) as being anticipated by Frank, et al., U.S. Patent No. 6,532,494 (Frank). Claims 1-31 are being appealed.

Frank fails to teach or suggest a method including:

providing a coordinator virtual device corresponding to at least a portion of a physical data storage device;

detecting when a computer system cluster, including a plurality of nodes, is partitioned;

attempting to gain control of the coordinator virtual device; and

removing at least one of the plurality of nodes from the computer system cluster when the attempting is unsuccessful,

as required by independent claim 1 and generally required by independent claim 28.

Regarding the claimed “providing a coordinator virtual device corresponding to at least a portion of a physical data storage device,” (and the related operation of attempting to gain control of the virtual coordinator device) the Examiner has identified no less than *four* different possible elements in Frank as teaching claimed coordinator virtual device.

These possible elements are:

- (1) a single virtual computer formed from cluster nodes and appearing to an end user as a single computing resource (Frank, column 1, lines 30-40 as cited in the Final Office Action of January 27, 2006, p. 2, no. 1(a));
- (2) shareable storage 22 (Frank, column 3, lines 35-45 as cited in the Final Office Action of January 27, 2006, p. 2, no. 1(a));
- (3) a cluster manager 32 (See, e.g., Frank, abstract and column 4, lines 31-42, as generally referenced in the Final Office Action of January 27, 2006, p. 12, ¶b); and
- (4) a coordinator node (Frank, column 8, lines 43-61 as cited in the Advisor Action of April 24, 2006, p. 2, response ¶a).

As an initial matter, the appellants respectfully submit that such use of Frank is inappropriate as a basis for a §102 rejection. MPEP §2131 makes clear the requirements for anticipation:

“A claim is anticipated only if each and every element as set forth in the claim is found, either expressly or inherently described, in a single prior art reference.” *Verdegaal Bros. v. Union Oil Co. of California*, 814 F.2d 628, 631, 2 USPQ2d 1051, 1053 (Fed. Cir. 1987). . . . “The identical invention must be shown in as complete detail as is contained in the . . . claim.” *Richardson v. Suzuki Motor Co.*, 868 F.2d 1226, 1236, 9 USPQ2d 1913, 1920 (Fed. Cir. 1989). The elements must be arranged as required by the claim, but this is not an *ipsissimis verbis* test, i.e., identity of terminology is not required. *In re Bond*, 910 F.2d 831, 15 USPQ2d 1566 (Fed. Cir. 1990). (Emphasis added)

Thus, in addition to showing every element, the reference must teach their arrangement as required by the claim. It is unclear how this requirement can be met by the Examiner when the Examiner has identified at least four distinct elements that might be the claimed coordinator virtual device. Nevertheless, each of these arguments are addressed below.

Frank's single virtual computer formed from cluster nodes and appearing to an end user as a single computing resource is not a coordinator virtual device. The cited portion of Frank states:

As is known in the art, a computer network cluster is a collection of interconnected computers which share resources such as data storage. The individual computers, or nodes, are connected through both a physical and a software-level interconnect. The independent nodes are integrated into a single virtual computer, appearing to an end user as a single computing resource. If one node fails, the remaining nodes will handle the load previously handled by the failed node. This multiple computer environment provides many benefits to a user including high availability and increased speed of operation. (column 1, lines 30-40)

This paragraph describes a network cluster, but says nothing about a coordinator virtual device. The network cluster of the paragraph simply describes independent nodes of a cluster are integrated into a single virtual computer and appear to an end user as a single computing resource. The appellants respectfully submit that Frank's cluster as a whole neither teaches nor suggests the claimed "coordinator virtual device," which is not a cluster. The coordinator virtual device is used, for example, to assist in removing one of the nodes from a cluster when the cluster is partitioned and is clearly not the cluster itself. Frank further fails to teach or suggest an attempt to gain control of this network cluster as a whole.

Frank's shareable storage 22 is not a coordinator virtual device. The referenced portion of Frank states:

Here, shareable storage 22 has been illustrated as a single storage disk or the like. It should be understood by one of ordinary skill in the art that the shareable storage may include multiple storage devices. To implement multiple storage devices as the shareable storage 22, a header 25 of each storage device may include data indicating the identity of all devices comprising the shareable storage 22, a version number for information contained in the header 25, and any other pertinent data. To gain membership in the quorumless cluster 10, a node must have access to all storage devices comprising the shareable storage 22. (column 3, lines 34-45).

This portion of Frank merely describes shareable storage for use by cluster nodes. Although Frank does teach that to gain membership in the quorumless cluster, a node must have access to all storage devices comprising the shareable storage, Frank fails to

teach or suggest that the shareable storage is a coordinator virtual device. Moreover, Frank's sharable storage is not something for which an attempt is made to gain control, as would be necessary to comport with the appellants' claims. In other words, mere access to a shareable storage device is not the same as control of the shareable storage device.

Frank's cluster manager 32 is not a coordinator virtual device. The Examiner states "Frank shows the use of a cluster manager, herein interpreted as a coordinator virtual device that oversees the removal and addition of nodes while considering whether or not the attempt to gain control of the coordinator virtual device is successful." Final Office Action of January 27, 2006, p. 12, ¶b. This argument is paradoxical in the sense that the Examiner is suggesting the cluster manager oversees removal of nodes (which might include the cluster manager itself) while considering whether or not the attempt to gain control of *itself* (i.e., that which the Examiner equates with the coordinator virtual device) is successful. Moreover, this line of argument is also inconsistent with the teachings of Frank. Frank describes the cluster manager as follows:

Specifically, the cluster manager 32 manages cluster connectivity in the computer network cluster 10. For example, the cluster manager 32 can oversee the addition of nodes to and removal of nodes from the computer network cluster 10. It can also prevent the cluster 10 from partitioning into multiple cluster partitions. In addition, as an entity, such as an application or distributed lock manager, begins operating on node_1 12 and within the quorumless cluster 10, the entity may register with the cluster manager 32. Registration with the cluster manager 32 signifies that the entity requests that changes in cluster membership, among other things, be communicated to the entity by the cluster manager 32. (column 4, lines 31-42)

Note that cluster managers reside on each node. Column 4, lines 16-18. Frank fails to teach or suggest that the cluster manager is a virtual device, or a coordinator virtual device within the meaning of the term as used by the appellants. It is also unclear what way, if any, a cluster manager corresponds to at least a portion of a physical data storage device, as required by appellants claims. There is also nothing in Frank teaching or suggesting attempting to gain control of a cluster manager, either by a cluster manager itself, or any other entity.

Finally, Frank's coordinator node is not a coordinator virtual device. In the Advisory Action of April 24, 2006, the Examiner states: "Frank discloses if a coordinator

node fails to operate during an update to the cluster definition, the remaining nodes of the cluster select a new coordinator node upon loss of the coordinator node” The referenced portion (column 8, lines 43-61) of Frank states:

The log file 54 and valid bits 51a-51d provide a means by which the quorumless cluster can recover if, during an update to the cluster definition 48, the coordinator node fails to operate. Upon loss of the coordinator node, the remaining nodes, node_1 12, node_2 14 and node_4 18, of the quorumless cluster 10 select a new coordinator node.

For illustrative purposes, it will be assumed that the remaining nodes designate node_4 18 as the coordinator node. Upon designation as coordinator node, node_4 18 checks the state of the repository 46 to determine whether an update to the cluster definition 48 was left incomplete by the failure of the former coordinator node, node_3 16.

If a valid bit 51a-51d is set in the scratch area 50, the new coordinator node will examine the log file to determine whether an update had been started by the former coordinator node. If it was, the coordinator node parses the log file to determine where during the update process the former coordinator node failed. The new coordinator node completes the update from the identified point on.

Frank teaches that a coordinator node can update the cluster definition and apply the suggested changes. However, the coordinator node is still one of the nodes in the cluster. It is not a coordinator virtual device. Moreover, there is no teaching or suggestion of an attempt to gain control of the coordinator node. An existing coordinator node may leave the cluster, and a new coordinator node may be selected, but neither of these operations teaches or suggests attempting to gain control of either a lost or a new coordinator node.

Additionally regarding independent claim 15, Frank fails to teach or suggest a system including:

a virtual device configuration server coupled to the first storage device and including a first memory and a first processor configured to provide a coordinator virtual device corresponding to at least a portion of the first data storage device;

a plurality of virtual device configuration clients configured as a computer system cluster, at least one of the plurality of virtual device configuration clients including a second memory and a second processor configured to:

detect when the computer system cluster is partitioned;

attempt to gain control of the coordinator virtual device corresponding to at least a portion of the first data storage device; and

remove the at least one of the plurality of virtual device configuration clients from the computer system cluster when the attempt to gain control of the coordinator virtual device is unsuccessful.

For the same reasons as stated above, Frank fails to teach or suggest the claimed coordinator virtual device and the functionality to attempt to gain control of the coordinator virtual device.

Regarding the virtual device configuration server, the Examiner refers to Figure 5, and column 7, line 54 through column 8, line 15 which states:

Upon entering the proposed changes to the cluster definition 48 in the scratch area 50a, node_1 12 sets the valid bit 51a to indicate that it has completed entering its changes and notifies the coordinator node, node_3 16, that it has proposed changes to the cluster definition 48 at step 62. The coordinator node, node_3 16, verifies that the valid bit has been set and sets the update in progress flag 56 at step 64 to indicate that an update of the cluster definition 48 is in progress.

The coordinator node reads the scratch area 50a for the proposed changes at step 66 and increments the version number 58 of the repository to indicate a change is being made to the cluster definition 48 at step 68. At step 70, the coordinator node updates the cluster definition 48, to reflect the proposed changes. In addition, the coordinator node logs a progression of the update procedure in the log file 54. At step 72, the coordinator node clears the valid bit 51a and the update in progress flag 56.

As described above, the cluster definition 48 may be comprised of multiple copies. See FIG. 4. Updates to multiple copies may be accomplished in the manner described above where step 68 is implemented in parallel across all copies of the cluster definition at once.

In an alternate embodiment including multiple copies of the cluster definition, the coordinator node reads the scratch area 50a and updates a backup definition 48b (as identified by the map file 52).

This portion of Frank discusses coordinator node operation, but it is unclear from the Examiner's reference what element of Frank is believed to correspond to the appellants' virtual device configuration server. If it is the coordinator node itself, the appellants' respectfully disagree. Nothing in the cited portion of Frank teaches or suggests that a coordinator node is "configured to provide a coordinator virtual device corresponding to

at least a portion of the first data storage device.” The appellants are left to conclude that it is the Examiner’s position that the node is *both* the claimed virtual coordinator device and the virtual device configuration server. Such an argument is inconsistent with the claimed separate limitations and is simply not supported by Frank.

Accordingly, the appellants respectfully submit that independent claims 1, 15, and 28 are allowable over Frank. Dependent claims 2-14, 16-27, and 29-31 depend from independent claims 1, 15, and 28, respectively, and are allowable for at least this reason.

CONCLUSION

The appellants respectfully submit that claims 1-31 are allowable for at least the reasons stated above. The appellants respectfully request that the Board reverse the rejections of these claims.

I hereby certify that this correspondence is being deposited with the United States Postal Service as First Class Mail in an envelope addressed to: Mail Stop Appeal Brief - Patents, Commissioner for Patents, P.O. Box 1450, Alexandria, VA, 22313-1450, on <u>July 31</u> , 2006.

CLAIMS APPENDIX

1 1. A method comprising:
2 providing a coordinator virtual device corresponding to at least a portion of a
3 physical data storage device;
4 detecting when a computer system cluster, including a plurality of nodes, is
5 partitioned;
6 attempting to gain control of the coordinator virtual device; and
7 removing at least one of the plurality of nodes from the computer system cluster
8 when the attempting is unsuccessful.

1 2. The method of claim 1 wherein the providing a coordinator virtual device
2 corresponding to at least a portion of a physical data storage device further comprises:
3 selecting the at least a portion of a physical data storage device;
4 associating a physical description of the at least a portion of a physical data
5 storage device with a coordinator virtual device identifier; and
6 allowing at least one of the plurality of nodes of the computer cluster to access the
7 at least a portion of a physical data storage device via the coordinator
8 virtual device identifier.

1 3. The method of claim 1 wherein the providing a coordinator virtual device
2 corresponding to at least a portion of a physical data storage device is performed by at
3 least one virtual device configuration server.

1 4. The method of claim 3 wherein the at least one virtual device configuration
2 server is separate from the plurality of nodes of the computer cluster and wherein at least
3 one of the plurality of nodes of the computer cluster further comprises a virtual device
4 configuration client.

1 5. The method of claim 1 further comprising:
2 reading cluster membership information from the coordinator virtual device
3 corresponding to at least a portion of a physical data storage device.

1 6. The method of claim 1 wherein the detecting when a computer system cluster,
2 including a plurality of nodes, is partitioned further comprises:

3 reading, as performed by one of the plurality of nodes, cluster membership
4 information from the coordinator virtual device corresponding to at least a
5 portion of a physical data storage device; and
6 determining whether the cluster membership information indicates that the one of
7 the plurality of nodes is a current member of the computer system cluster.

1 7. The method of claim 1 further comprising:

2 writing cluster membership information to the coordinator virtual device
3 corresponding to at least a portion of a physical data storage device.

1 8. The method of claim 1 wherein the coordinator virtual device corresponding to
2 at least a portion of a physical data storage device further comprises cluster membership
3 information.

1 9. The method of claim 1 wherein the coordinator virtual device corresponding to
2 at least a portion of a physical data storage device is a coordinator volume.

1 10. The method of claim 1 wherein the detecting when a computer system
2 cluster, including a plurality of nodes, is partitioned further comprises:
3 monitoring a network coupled to each of the plurality of nodes for a heartbeat
4 signal; and
5 determining when the heartbeat signal is not present for a specified period of time.

1 11. The method of claim 1 further comprising:

2 retaining the at least one of the plurality of nodes in the computer system cluster
3 when the attempting is successful.

1 12. The method of claim 1 encoded in a computer readable medium as
2 instructions executable on a processor, the computer readable medium being one of an

3 electronic storage medium, a magnetic storage medium, an optical storage medium, and a
4 communications medium conveying signals encoding the instructions.

1 13. The method of claim 1 further comprising:
2 allowing at least one of the plurality of nodes of the computer cluster to
3 exclusively access the at least a portion of a physical data storage device.

1 14. The method of claim 1 further comprising:
2 obtaining exclusive access to the at least a portion of a physical data storage
3 device.

1 15. A system comprising:
2 a first data storage device;
3 a virtual device configuration server coupled to the first storage device and
4 including a first memory and a first processor configured to provide a
5 coordinator virtual device corresponding to at least a portion of the first
6 data storage device;
7 a plurality of virtual device configuration clients configured as a computer system
8 cluster, at least one of the plurality of virtual device configuration clients
9 including a second memory and a second processor configured to:
10 detect when the computer system cluster is partitioned;
11 attempt to gain control of the coordinator virtual device corresponding to
12 at least a portion of the first data storage device; and
13 remove the at least one of the plurality of virtual device configuration
14 clients from the computer system cluster when the attempt
15 to gain control of the coordinator virtual device is
16 unsuccessful.

1 16. The system of claim 15 wherein virtual device configuration server is further
2 configured to:
3 select the at least a portion of the first data storage device;

4 store a coordinator virtual device identifier associated with a physical description
5 of the at least a portion of the first data storage device; and
6 allow the at least one of the plurality of virtual device configuration clients to
7 access the at least a portion of the first data storage device via the
8 coordinator virtual device identifier.

1 17. The system of claim 15 wherein the first data storage device is at least one of
2 a disk drive, a JBOD, a disk array, and an integrated circuit.

1 18. The system of claim 15 wherein the first data storage device is coupled to the
2 virtual device configuration server via a network.

1 19. The system of claim 15 wherein the virtual device configuration server is a
2 volume server, wherein the coordinator virtual device is a coordinator volume, and the
3 plurality of virtual device configuration clients is a plurality of volume clients.

1 20. The system of claim 15 wherein the at least one of the plurality of virtual
2 device configuration clients is further configured to read cluster membership information
3 from the coordinator virtual device corresponding to at least a portion of the first data
4 storage device.

1 21. The system of claim 20 wherein the at least one of the plurality of virtual
2 device configuration clients is further configured to determine whether the cluster
3 membership information indicates that the at least one of the plurality of virtual device
4 configuration clients is a current member of the computer system cluster.

1 22. The system of claim 15 wherein the at least one of the plurality of virtual
2 device configuration clients is further configured to write cluster membership information
3 to the coordinator virtual device corresponding to at least a portion of the first data
4 storage device.

1 23. The system of claim 15 wherein the coordinator virtual device corresponding
2 to at least a portion of the first data storage device further comprises cluster membership
3 information.

1 24. The system of claim 15 wherein the at least one of the plurality of virtual
2 device configuration clients is further configured to retain the at least one of the plurality
3 of virtual device configuration clients in the computer system cluster when the attempt to
4 gain control of the coordinator virtual device is successful.

1 25. The system of claim 15 wherein the first memory and the virtual device
2 configuration server belong to at least one of a host computer system, a cluster node, a
3 storage appliance, a network appliance, and a storage area network (SAN) switch.

1 26. The system of claim 15 wherein the at least one of the plurality of virtual
2 device configuration clients is further configured to obtain exclusive access to the
3 coordinator virtual device.

1 27. The system of claim 15 wherein the virtual device configuration server is
2 further configured to allow exclusive access to the coordinator virtual device by the at
3 least one of the plurality of virtual device configuration clients.

1 28. An apparatus comprising:
2 a means for providing a coordinator virtual device corresponding to at least a
3 portion of a physical data storage device;
4 a means detecting when a computer system cluster, including a plurality of nodes,
5 is partitioned;
6 a means for attempting to gain control of the coordinator virtual device; and
7 a means for removing at least one of the plurality of nodes from the computer
8 system cluster when the attempting is unsuccessful.

1 29. The apparatus of claim 28 further comprising:
2 a means for reading cluster membership information from the coordinator virtual
3 device corresponding to at least a portion of a physical data storage
4 device.

1 30. The apparatus of claim 28 further comprising:
2 a means for writing cluster membership information to the coordinator virtual
3 device corresponding to at least a portion of a physical data storage
4 device.

1 31. The apparatus of claim 28 further comprising:
2 a means for determining whether cluster membership information stored in the
3 coordinator virtual device corresponding to at least a portion of a physical
4 data storage device indicates that the one of the plurality of nodes is a
5 current member of the computer system cluster.
